Abstract

In this paper, we consider some differential subordinations and superordinations results for univalent functions by using the operator $(H_{\sigma,\rho,\tau,\mu,y,n})$. Also, we introduce some sandwich theorems.

Keywords: Univalent Function, Analytic Function, Subordination, Superordination, Sandwich theorem
2020 MSC: 30C45

1 Introduction

Assume that $H = H(U)$ be the class of analytic functions in the open unit disk $U = \{z \in \mathbb{C} : |z| < 1\}$. For $n \in \mathbb{N}$ and $a \in \mathbb{C}$, $H[a, n]$ is the subclass of H with the following form:

$$f(z) = a + a_n z^n + a_{n+1} z^{n+1} + \dots, \quad (a \in \mathbb{C}) \quad (1.1)$$

Let M be the subclass of H , consisting of analytic and univalent functions f in U of the form:

$$f(z) = z + \sum_{n=2}^{\infty} a_n z^n, \quad (z \in U) \quad (1.2)$$

If f and g are analytic functions in H , then we say that f is subordinate to g in U and written $f \prec g$, if there exists a Schwarz function w in U , with $w(0) = 0$, and $|w(z)| < 1$, ($z \in U$), where $f(z) = g(w(z))$. In this situation, we write $f \prec g$ or $f(z) \prec g(z)$ ($z \in U$) [11]. In addition, if the function g is univalent in U , then $f \prec g \iff f(0) = g(0)$ and $f(U) \subset g(U)$ [14, 15].

Definition 1.1. [18] Let $\varphi : \mathbb{C}^3 \times U \rightarrow \mathbb{C}$ and $h(z)$ be univalent in U . If $p(z)$ is analytic function in U and satisfies the second-order differential subordination:

$$\varphi(p(z), zp'(z), z^2 p''(z); z) \prec h(z) \quad (1.3)$$

*Corresponding author

Email addresses: hodah.almrzouk@uokufa.edu.iq (Huda Hayder Jasim), waggas.galib@qu.edu.iq (Waggas Galib Atshan)

then $p(z)$ is called a solution of the differential subordination (1.3), and the univalent function $q(z)$ is called a dominant of the solution of the differential subordination (1.3), moreover simply a dominant, if $p(z) \prec q(z)$ for all $p(z)$ satisfying (1.3). A univalent dominant $\tilde{q}(z)$ that satisfies $\tilde{q}(z) \prec q(z)$ for all dominant $q(z)$ of (1.3) is said to be the best dominant of (1.3).

Definition 1.2. [14] Let $\varphi : \mathbb{C}^3 \times U \rightarrow \mathbb{C}$ and $h(z)$ be univalent in U . If $p(z)$ and $\psi(p(z), zp'(z), z^2p''(z); z)$ are univalent functions in U and if $p(z)$ satisfies the second -order differential superordination:

$$h(z) \prec \varphi(p(z), zp'(z), z^2p''(z); z), \quad (1.4)$$

then $p(z)$ is called the solution of the differential superordination (1.4). An analytic function $q(z)$ is called subordinated of the solution of the differential superordination (1.4), or more simply a subordinated, if $q(z) \prec p(z)$ for all the functions p satisfying (1.4). A univalent subordinated \tilde{q} that satisfies $q(z) \prec \tilde{q}(z)$ for all the subordinated $q(z)$ of (1.4) is said to be the best subordinated.

Several authors, like, [1, 2, 3, 9, 18, 19, 20] recently attained the sufficient conditions on the functions h, p and φ for which the following conclusion is true:

$$h(z) \prec \varphi(p(z), zp'(z), z^2p''(z); z)$$

then

$$q(z) \prec p(z) \quad (1.5)$$

By using the results of other authors (see [4, 5, 6, 7, 8, 10, 15]) to get sufficient conditions for normalized analytic functions to satisfy:

$$q_1(z) \prec \frac{zf'(z)}{f(z)} \prec q_2(z),$$

where q_1 and q_2 are given univalent functions in U with $q_1(0) = q_2(0) = 1$. Also, several authors derived some differential subordination and superordination results with sandwich theorems (like [2, 4, 5, 6, 10, 11, 12, 13, 16, 17, 19]).

Suppose $f \in M$, the modern operator defined by Theyab et al. [20] is as follows: $H_{\sigma, \rho, \tau, \mu, y, n} f(z) : M \rightarrow M$, where σ, ρ are integer numbers; $\tau, \mu, y, n \in \mathbb{C} \setminus Z_0^-, Z_0^- = \{0, -1, -2, \dots\}$ and

$$H_{\sigma, \rho, \tau, \mu, y, n} f(z) = z + \sum_{n=2}^{\infty} \left[\frac{\tau y + \mu + n}{\tau y + \mu + 1} \right]^{\sigma + \rho + 1} a_n z^n. \quad (1.6)$$

From (1.6), we note that

$$z(H_{\sigma, \rho, \tau, \mu, y, n} f(z))' = (\tau y + \mu + 1)H_{\sigma-1, \rho, \tau, \mu, y, n} f(z) - (\tau y + \mu)H_{\sigma, \rho, \tau, \mu, y, n} f(z). \quad (1.7)$$

The major aim of the paper is to identify the necessary conditions for particular normalized analytic function f to satisfy:

$$q_1(z) \prec \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{Z} \right]^{\eta} \prec q_2(z),$$

and

$$q_1(z) \prec \left[\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^{\eta} \prec q_2(z),$$

where the functions q_1 and q_2 are univalent in U and $q_1(0) = q_2(0) = 1$.

In this paper, using the operator $H_{\sigma, \rho, \tau, \mu, y, n} f(z)$, we derive certain sandwich theorems.

2 Preliminaries

The following lemmas and definitions are necessary to prove our results.

Definition 2.1. [14] Denote by Q the set of all functions f that are analytic and injective on $\bar{U} \setminus E(f)$, where $\bar{U} = U \cup \{z \in \partial U\}$, and

$$E(f) = \{\varepsilon \in \partial U : \lim_{z \rightarrow \varepsilon} f(z) = \infty\}$$

and are such that $f'(\varepsilon) \neq 0$ for $\varepsilon \in \partial U \setminus E(f)$. Further, let the subclass of Q for which $f(0) = a$ be denoted by $Q(a)$, $Q(0) = Q_0$ and $Q(1) = Q_1$.

Lemma 2.2. [15] Let $q(z)$ be a convex univalent function in U and let $\alpha \in \mathbb{C}, \beta \in \mathbb{C} \setminus \{0\}$ with

$$\operatorname{Re} \left\{ 1 + \frac{zq''(z)}{q'(z)} \right\} > \max \left\{ 0, -\operatorname{Re} \left(\frac{\alpha}{\beta} \right) \right\}.$$

If $\mathcal{T}(z)$ is analytic function in U and

$$\alpha\mathcal{T}(z) + \beta z\mathcal{T}'(z) \prec \alpha q(z) + \beta zq'(z), \quad (2.1)$$

then $\mathcal{T}(z) \prec q(z)$ and $q(z)$ is the best dominant.

Lemma 2.3. [15] Let q be convex univalent function in U , and let θ and ϕ be analytic in a domain \mathcal{D} containing $q(U)$ with $\phi(w) \neq 0$, when $w \in q(U)$. Set

$$Q(z) = zq'(z)\phi h(q(z)) \text{ and } h(z) = \theta(q(z)) + Q(z).$$

Suppose that

$$1 - Q(z) \text{ is starlike univalent in } U.$$

$$2 - \operatorname{Re} \left\{ \frac{zh'(z)}{Q(z)} \right\} > 0 \text{ for } z \in U.$$

If \mathcal{T} is analytic in U , with $\mathcal{T}(0) = q(0), \mathcal{T}(U) \subseteq \mathcal{D}$ and

$$\theta(\mathcal{T}(z)) + z\mathcal{T}'(z)\phi(\mathcal{T}(z)) \prec \theta(q(z)) + zq'(z)\phi(q(z)), \quad (2.2)$$

then $\mathcal{T} \prec q$ and q is the best dominant.

Lemma 2.4. [14] Let q be a convex univalent in U and let $\beta \in \mathbb{C}$, that $\operatorname{Re}(\beta) > 0$. If $\mathcal{T} \in \mathcal{H}[q(0), 1] \cap Q$ and $\mathcal{T}(z) + \beta z\mathcal{T}'(z)$ is univalent in U , then

$$q(z) + \beta zq'(z) \prec \mathcal{T}(z) + \beta z\mathcal{T}'(z), \quad (2.3)$$

which implies that $q \prec \mathcal{T}$ and q is the best subordinant.

Lemma 2.5. [14] Let q be a convex univalent function in U and let θ and ϕ be analytic in a domain \mathcal{D} containing $q(U)$. Suppose that

$$1 - \operatorname{Re} \left\{ \frac{\theta'(q(z))}{\phi(q(z))} \right\} > 0, \text{ for } z \in U.$$

$2 - Q(z) = zq'(z)\phi(q(z))$ is starlike univalent in U .

If $\mathcal{T} \in \mathcal{H}[q(0), 1] \cap Q$, with $\mathcal{T}(U) \subset \mathcal{D}, \theta(\mathcal{T}(z)) + z\mathcal{T}'(z)\phi(\mathcal{T}(z))$ is univalent in U and

$$\theta(q(z)) + zq'(z)\phi(q(z)) \prec \theta(\mathcal{T}(z)) + z\mathcal{T}'(z)\phi(\mathcal{T}(z)), \quad (2.4)$$

then $q \prec \mathcal{T}$ and q is the best subordinant.

3 Differential Subordination Results

Theorem 3.1. Assume that the function $q(z)$ is convex univalent in unit disk U with $q(0) = 1, \zeta \in \mathbb{C} \setminus \{0\}, \eta > 0$ such that

$$Re \left\{ 1 + \frac{zq''(z)}{q'(z)} \right\} > \max \left\{ 0, -Re \left(\frac{\eta}{\zeta} \right) \right\}. \quad (3.1)$$

If $f \in M$ satisfies the subordination condition:

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right) \prec q(z) + \frac{\zeta}{\eta} zq'(z) \quad (3.2)$$

then

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \prec q(z), \quad (3.3)$$

and $q(z)$ is the best dominant.

Proof . Putting

$$\mathcal{T}(z) = \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta, \quad (3.4)$$

then the function $\mathcal{T}(z)$ is analytic in U and $\mathcal{T}(0) = 1$. By differentiating (3.4) with respect to z , we have

$$\frac{z\mathcal{T}'(z)}{\mathcal{T}(z)} = \eta \left[\frac{z(H_{\sigma-1, \rho, \tau, \mu, y, n} f(z))'}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right]. \quad (3.5)$$

Now, by using the identity (1.7) in (3.5), we get

$$\frac{z\mathcal{T}'(z)}{\mathcal{T}(z)} = \eta \left[(\tau y + \mu + 1) \left(\frac{z(H_{\sigma-1, \rho, \tau, \mu, y, n} f(z))'}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right) \right].$$

Therefore,

$$\frac{z\mathcal{T}'(z)}{\eta} = \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left[(\tau y + \mu + 1) \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right) \right].$$

The subordination (3.2) because of the assumption becomes

$$\mathcal{T}(z) + \frac{\zeta}{\eta} z\mathcal{T}'(z) \prec q(z) + \frac{\zeta}{\eta} zq'(z).$$

We will use Lemma 2.2 with $\beta = \frac{\zeta}{\eta}$ and $\alpha = 1$, to prove our result. Therefore, the subordination (3.2) implies that $\mathcal{T}(z) \prec q(z)$ and $q(z)$ is the best dominant. This completes the proof. \square

By putting the convex function $q(z) = \left(\frac{1+Az}{1+Bz} \right)$ ($-1 \leq B < A \leq 1$) in theorem 3.1, we have the next result.

Corollary 3.2. Let $\zeta \in \mathbb{C} \setminus \{0\}, \eta > 0$ and

$$Re \left\{ \frac{1 - Bz}{1 + Bz} \right\} > \max \left\{ 0, -Re \left(\frac{\eta}{\zeta} \right) \right\}.$$

If $f \in M$ satisfies the subordination condition:

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right) \prec \frac{1 + Az}{1 + Bz} + \frac{\zeta}{\eta} \frac{(A - B)z}{(1 + Bz)^2},$$

then

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \prec \left(\frac{1 + Az}{1 + Bz} \right)$$

and $q(z) = \left(\frac{1+Az}{1+Bz} \right)$ is the best dominant.

Putting $A = 1$ and $B = -1$ in above corollary, we obtain the next result.

Corollary 3.3. Let $\zeta \in \mathbb{C} \setminus \{0\}$, $\eta > 0$ and

$$\operatorname{Re} \left\{ 1 + \frac{2z}{1-z} \right\} > \max \left\{ 0, -\operatorname{Re} \left(\frac{\eta}{\zeta} \right) \right\}.$$

If $f \in M$ satisfies the subordination condition:

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right) \prec \left(\frac{1-z^2 + 2\frac{\zeta}{\eta}z}{(1-z)^2} \right),$$

then

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \prec \left(\frac{1+z}{1-z} \right),$$

and $q(z) = \left(\frac{1+z}{1-z} \right)$ is the best dominant.

Theorem 3.4. Assume that the function $q(z)$ is convex univalent function in U with $q(0) = 1$, $q'(z) \neq 0$ and $\frac{zq'(z)}{q(z)}$ is starlike univalent in U . If q satisfy the next condition:

$$\operatorname{Re} \left\{ 1 + \frac{v}{\gamma} q(z) + \frac{2\tau\rho}{\gamma} - \frac{zq'(z)}{q(z)} + \frac{zq''(z)}{q'(z)} \right\} > 0, \quad (3.6)$$

where $v, \tau, \rho \in \mathbb{C}$, $\gamma \in \mathbb{C} \setminus \{0\}$ and $z \in U$. If $f \in M$ satisfies:

$$\Psi(\eta, \rho, \tau, \mu, y, n, v; z) \prec t + vq(z) + \tau\alpha q(z)^2 + \gamma z \frac{q'(z)}{q(z)}, \quad (3.7)$$

where,

$$\begin{aligned} \Psi(\eta, \rho, \tau, \mu, y, n, v; z) &= \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right)^\eta \left(v + \tau\alpha \left(\left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right)^\eta + t \right) \right) \\ &+ \gamma\eta \left[(\tau y + \mu + 1) \left(\frac{H_{\sigma-2, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)} - \frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right) \right], \end{aligned} \quad (3.8)$$

then

$$\left[\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^\eta \prec q(z) \quad (3.9)$$

and $q(z)$ is the best dominant.

Proof . Putting

$$\mathcal{T}(z) = \left[\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^\eta, \quad (3.10)$$

then the function $\mathcal{T}(z)$ is analytic in U and $\mathcal{T}(0) = 1$. By differentiating (3.10) with respect to z , and by using identity (1.7) in the resulting equation, we get

$$\frac{z\mathcal{T}'(z)}{\mathcal{T}(z)} = \eta \left[(\tau y + \mu + 1) \left(\frac{H_{\sigma-2, \rho, \tau, \delta, \mu, y, n} f(z)}{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)} - \frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right) \right].$$

By setting

$$\theta(w) = t + vw + \tau\alpha w^2 \quad \text{and} \quad \phi(w) = \frac{\gamma}{w}, \quad w \neq 0.$$

It is simple to see that $\theta(w)$ is analytic in \mathbb{C} , and $\phi(w)$ is analytic in $\mathbb{C} \setminus \{0\}$ and that $\phi(w) \neq 0$, $w \in \mathbb{C} \setminus \{0\}$. As well, if we let

$$Q(z) = zq'(z)\phi(q(z)) = \gamma \frac{zq'(z)}{q(z)}$$

and

$$h(z) = \theta(q(z)) + Q(z) = t + vq(z) + \tau\alpha(q(z))^2 + \gamma \frac{zq'(z)}{q(z)}.$$

We see that $Q(z)$ is starlike univalent in U , we get

$$Re \left\{ \frac{zh'(z)}{Q(z)} \right\} = Re \left\{ 1 + \frac{v}{\gamma}q(z) + \frac{2\tau\rho}{\gamma} - \frac{zq'(z)}{q(z)} + \frac{zq''(z)}{q'(z)} \right\} > 0.$$

Through simple calculation, we find that

$$\Psi(\eta, \rho, \tau, \mu, y, n, v; z) = t + v\mathcal{T}(z) + \tau\alpha\mathcal{T}^2(z) + \gamma \frac{z\mathcal{T}'(z)}{\mathcal{T}(z)}, \quad (3.11)$$

where $\Psi(\eta, \rho, \tau, \mu, y, n, v; z)$ is given by (3.8). From (3.7) and (3.11), we have

$$t + v\mathcal{T}(z) + \tau\alpha\mathcal{T}(z)^2 + \gamma \frac{z\mathcal{T}'(z)}{\mathcal{T}(z)} \prec t + vq(z) + \tau\alpha q(z)^2 + \gamma \frac{zq'(z)}{q(z)} \quad (3.12)$$

We will use Lemma 2.3, to prove our result. Therefore, the subordination (3.7) implies that $\mathcal{T}(z) \prec q(z)$ and $q(z)$ is the best dominant. This completes the proof. \square

By putting the convex function $q(z) = \left(\frac{1+Az}{1+Bz}\right)$ ($-1 \leq B < A \leq 1$) in theorem 3.4, we get the next result.

Corollary 3.5. Let $v, \tau, \rho \in \mathbb{C}, \gamma \in \mathbb{C} \setminus \{0\}, z \in U$ and

$$Re \left\{ 1 + \frac{v}{\gamma} \left(\frac{1+Az}{1+Bz} \right) + \frac{2\tau\rho}{\gamma} + \frac{(A+B)z}{(1+Bz)(1+Az)} - \left(\frac{2Bz}{1+Bz} \right) \right\} > 0,$$

if $\Psi(\eta, \rho, \tau, \mu, y, n, v; z) \prec t + v \left(\frac{1+Az}{1+Bz}\right) + \tau\alpha \left(\frac{1+Az}{1+Bz}\right)^2 + \gamma \frac{z(A-B)}{(1+Bz)(1+Az)}$, where $\Psi(\eta, \rho, \tau, \mu, y, n, v; z)$ is given by (3.8), then

$$\left[\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^\eta \prec \left(\frac{1+Az}{1+Bz} \right)$$

and $q(z) = \left(\frac{1+Az}{1+Bz}\right)$ is the best dominant.

putting $A = 1$ and $B = -1$ in above corollary, we obtain the next result.

Corollary 3.6. Let $v, \tau, \rho \in \mathbb{C}, \gamma \in \mathbb{C} \setminus \{0\}, z \in U$ and

$$Re \left\{ 1 + \frac{v}{\gamma} \left(\frac{1+z}{1+z} \right) + \frac{2\tau\rho}{\gamma} + \frac{2z^2}{1-z^2} - \left(\frac{1+z}{1-z} \right) \right\} > 0,$$

if $\Psi(\eta, \rho, \tau, \mu, y, n, v; z) \prec t + v \left(\frac{1+z}{1+z}\right) + \tau\alpha \left(\frac{1+z}{1+z}\right)^2 + \gamma z \frac{2}{(1+z)(1+z)}$, where $\Psi(\eta, \rho, \tau, \mu, y, n, v; z)$ is given by (3.8), then

$$\left[\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^\eta \prec \left(\frac{1+z}{1+z} \right)$$

and $q(z) = \left(\frac{1+z}{1+z}\right)$ is the best dominant.

4 Differential Superordination Results

Theorem 4.1. Assume that the function $q(z)$ is a convex univalent in U with $q(0) = 1, Re\{\zeta\} > 0, \eta > 0$ and $f \in M$ such that

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \in \mathcal{H}[q(0), 1] \cap Q$$

and

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right)$$

be univalent in U . If

$$q(z) + \frac{\zeta}{\eta} z q'(z) \prec \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right), \quad (4.1)$$

then

$$q(z) \prec \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \quad (4.2)$$

and $q(z)$ is the best subordinator.

Proof . Putting

$$\mathcal{T}(z) = \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta. \quad (4.3)$$

Differentiating (4.3) with respect to z , we get

$$\frac{z\mathcal{T}'(z)}{\mathcal{T}(z)} = \eta \left[\frac{z(H_{\sigma, \rho, \tau, \mu, y, n} f(z))'}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right]. \quad (4.4)$$

After some computation and using (1.7), form (4.4), we get

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right) = \mathcal{T}(z) + \frac{\zeta}{\eta} z \mathcal{T}'(z),$$

we will use Lemma 2.4, to prove our result. Therefore, we get $T \prec q$ and q is the best subordinator. The proof is complete. \square

By putting the convex function $q(z) = \left(\frac{1+Az}{1+Bz} \right)$ ($-1 \leq B < A \leq 1$) in theorem 4.1, we get the next result.

Corollary 4.2. Let $Re\{\zeta\} > 0, \eta > 0$, suppose that

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \in \mathcal{H}[q(0), 1] \cap Q$$

and

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right)$$

be univalent in U , if

$$\left(\frac{1 - z^2 + 2 \left(\frac{\zeta}{\eta} \right) z}{(1 - z^2)} \right) \prec \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right),$$

then

$$\left(\frac{1+z}{1-z} \right) \prec \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta,$$

and $q(z) = \left(\frac{1+z}{1-z} \right)$ is the best subordinator.

Theorem 4.3. Assume that the function $q(z)$ is a convex univalent in U with $q(0) = 1, q'(z) \neq 0$ and $\frac{zq'(z)}{q(z)}$ is starlike univalent in U . If q satisfy the next condition:

$$Re \left\{ \frac{q(z)}{\gamma} (2\tau\alpha q(z) + v) q'(z) \right\} > 0, \quad (4.5)$$

where $v \in \mathbb{C}$, $\gamma \in \mathbb{C} \setminus \{0\}$ and $z \in U$. Let $f \in M$ satisfies

$$\left[\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^\eta \in \mathcal{H}[q(0), 1] \cap Q,$$

and $\Psi(\eta, \rho, \tau, \mu, y, n, v; z)$ is univalent in U , where is given by (3.8). If

$$t + vq(z) + \tau\alpha q^2(z) + \gamma \frac{zq'(z)}{q(z)} \prec \Psi(\eta, \rho, \tau, \mu, y, n, v; z), \quad (4.6)$$

then

$$q(z) \prec \left[\frac{H_{\sigma-1, \rho, \tau, \delta, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^\eta \quad (4.7)$$

and $q(z)$ is the best subordinator.

Proof . Putting

$$\mathcal{T}(z) = \left[\frac{H_{\sigma-1, \rho, \tau, \delta, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^\eta. \quad (4.8)$$

Differentiating (4.8) with respect to z , we get

$$\frac{z\mathcal{T}'(z)}{\mathcal{T}(z)} = \eta \left[(\tau y + \mu + 1) \left(\frac{H_{\sigma-2, \rho, \tau, \delta, \mu, y, n} f(z)}{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)} - \frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right) \right].$$

By setting

$$\theta(w) = t + vw + \tau\alpha w^2 \quad \text{and} \quad \phi(w) = \frac{\gamma}{w}, w \neq 0.$$

It is simple to see that $\theta(w)$ is analytic in \mathbb{C} , and $\phi(w)$ is analytic in $\mathbb{C} \setminus \{0\}$ and that $\phi(w) \neq 0, w \in \mathbb{C} \setminus \{0\}$. As well, if we let

$$Q(z) = zq'(z)Q(q(z)) = \gamma \frac{zq'(z)}{q(z)}.$$

We can observe that $Q(z)$ is starlike univalent in U , we get

$$Re \left\{ \frac{\theta'(q(z))}{\phi(q(z))} \right\} = Re \left\{ \frac{q(z)}{\gamma} (2\tau\alpha q(z) + v)q'(z) \right\} > 0.$$

Through simple calculation, we find that

$$\Psi(\eta, \rho, \tau, \mu, y, n, v; z) = t + v\mathcal{T}(z) + \tau\alpha\mathcal{T}^2(z) + \gamma z \frac{\mathcal{T}'(z)}{\mathcal{T}(z)}, \quad (4.9)$$

where $\Psi(\eta, \rho, \tau, \mu, y, n, v; z)$ is given by (3.8). Form (4.6) and (4.9), we get

$$t + vq(z) + \tau\alpha q(z)^2 + \gamma \frac{zq'(z)}{q(z)} \prec t + v\mathcal{T}(z) + \tau\alpha\mathcal{T}(z)^2 + \gamma \frac{z\mathcal{T}'(z)}{\mathcal{T}(z)}. \quad (4.10)$$

we will use Lemma 2.5, to prove our result. Therefore, we get $\mathcal{T} \prec q$ and q is the best subordinator. The proof is complete. \square

5 Sandwich Results

We arrive at the next sandwich theorem by combining theorems 3.1 and 4.1.

Theorem 5.1. Suppose that the functions $q_1(z)$ and $q_2(z)$ is convex univalent in U with $q_1(0) = q_2(0) = 1$ and q_2 satisfies (3.1), and suppose that $\eta > 0$ and $Re\{\zeta\} > 0$. Let $f \in M$ satisfies:

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \in \mathcal{H}[1, 1] \cap Q$$

and

$$\left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right)$$

be univalent in U . If

$$q_1(z) + \frac{\zeta}{\eta} z q_1'(z) \prec \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta + \zeta(\tau y + \mu + 1) \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \times \left(\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} - 1 \right) \prec q_2(z) + \frac{\zeta}{\eta} z q_2'(z),$$

then

$$q_1(z) \prec \left[\frac{H_{\sigma, \rho, \tau, \mu, y, n} f(z)}{z} \right]^\eta \prec q_2(z),$$

and q_1 and q_2 respectively the best subdominant and the best dominant.

We arrive at the next sandwich theorem by combining theorems 3.4 and 4.3.

Theorem 5.2. Suppose that the functions $q_1(z)$ and $q_2(z)$ are convex univalent in U with $q_1(0) = q_2(0) = 1$, and let $q_1(z)$ satisfies 4.5 and $q_2(z)$ satisfies (3.6). Assume that $f \in M$ satisfies:

$$\left[\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^\eta \in \mathcal{H}[1, 1] \cap \mathcal{Q}.$$

If

$$t + v q_1(z) + \tau \alpha q_1(z)^2 + \gamma \frac{z q_1'(z)}{q_1(z)} \prec \Psi(\eta, \rho, \tau, \mu, y, n, v; z) \prec t + v q_2(z) + \tau \alpha q_2(z)^2 + \gamma \frac{z q_2'(z)}{q_2(z)}$$

such that $\Psi(\eta, \rho, \tau, \mu, y, n, v; z) \prec t + v q_2(z) + \tau \alpha q_2(z)^2 + \gamma \frac{z q_2'(z)}{q_2(z)}$ is univalent in U , and given by (3.8). Then

$$q_1(z) \prec \left[\frac{H_{\sigma-1, \rho, \tau, \mu, y, n} f(z)}{H_{\sigma, \rho, \tau, \mu, y, n} f(z)} \right]^\eta \prec q_2(z)$$

and q_1 and q_2 respectively the best subdominant and the best dominant.
